

## VERITRAK™ :: PORTABLE VERIFICATION AND TRACKING

VERITRAK™ is Tri-Optic's portable verification device and integrated software that has the ability to read and verify Radio Frequency (RFID) Tags. This allows inventories to be taken by simply walking into a room and passing the reader close to the tape or case of tapes. In this way human error is eliminated and the tapes can be verified and inventoried quickly and efficiently saving both time and money.

### THE HARDWARE

Our handheld readers have been chosen with flexibility in mind and our PortaTrak software integrates with most of today's portable/handheld scanners. Here are a few features common to compatible handheld scanners:

- UHF Reading Capabilities
- Data Rates of up to 54Mbps
- Frequencies from 860 - 960MHz
- RFID and Barcode Scanning
- Reading Distances of 10' or more

### THE SOFTWARE

PORTATRAK™ is Tri-Optic's RFID Utility software for matching the unique identifiers of each tag to an existing database, or generating a new identifier on the fly using the auto increment function.

In less than a second, PortaTrak can scan dozens of RFID tags eliminating two error-prone and time-consuming activities: manual data collection and data entry. PortaTrak bypasses these two steps, providing a quick, accurate, and cost-effective way to collect and enter data. PortaTrak allows you to enter any number and associate this number with the RFID Tag. This allows easy conversion from using barcodes to using RFID technology. PortaTrak can link with most databases through an ODBC link.
